

A measured step forward

May, 2005

Lutz - JESCO America Corporation has taken another "measured step forward" by offering accessories that will improve your system's ...

Efficiency & Safety

Back Pressure / Pressure Relief Valve

Back Pressure Valve

- Ensures proper seating and closing of the pump check valves, which guarantees accurate metering and prevents siphoning
- Required when down stream pressure is insufficient for maximum pump efficiency (i.e. pumping into open reservoir or tank)

Pressure Relief Valve

- Avoids overpressure conditions by opening and releasing chemical back to the storage tank

Pulsation Dampener

- Protects chemical feed systems and metering pumps from damaging vibrations and water hammer that are common in metering pump applications
- Unique inline design efficiently dampens pressure pulses, creating a near pulse-less flow

Diaphragm Leakage Detector

- Senses accidental diaphragm failure, due to wear and tear or inadmissible pressure peaks
- Alerts operating personnel via relay
